

Introduction and Studying at University

**UNIVERSITY
OF WARWICK**

Department of
Computer Science

Staff

Mike Joy

Professor

Room: CS3.28

Office Hours: email me for an appointment

E-mail: m.s.joy@warwick.ac.uk

I am an [Information Systems Engineer](#),
with particular research interests in
educational technology, computer science
education, and declarative programming.

Welcome!

Three broad classes of professional skill:

- 1) Computers and operating systems – utilisation and application (term 1)
- 2) Wider social context – legal, ethical and professional issues (term 2)
- 3) Communication skills – presentations and technical writing (terms 1 and 2)

Module Aims

Provide you with a basic **understanding** of operating systems concepts together with a working knowledge of computing systems and associated tools and applications that will subsequently be used;

Introduce you to the **concept** of professional ethics and behaviour, the place of computers in society and the legal aspects of computing, and the importance of personal development planning;

Develop your **skills** in summarising, quoting, paraphrasing, critical analysis, grammar, referencing and oral presentation, and teaching writing as a process approach to composing academic papers.

Learning Outcomes

- Practice **presentation skills** and use **information systems** available via the network at Warwick
- Understand basic computing and **operating systems concepts**, apply them to a networked computer system, and use standard applications and system tools
- Judge and improve your own writing with increased confidence, utilise appropriate methods for referring and citing sources, and be familiar with the idea of writing as a process
- Understand the **relevance** for professional computing practice of **basic computer law**, professional bodies, and the **social impact** of computer technology
- Understand the importance of **continuing professional development** and demonstrate their understanding through development of a **personal development plan**

Term 1 Timetable

Lectures (Weeks 1-10)

2 lectures per week

Lab sessions (Weeks 2-10)

Attendance is monitored – sign in with card

If you must miss a lab then you should e-mail Mike ASAP

All lab sessions are held in the terminal rooms CS0.01 and CS0.06

- Seven groups – see allocation on Tabula – **Check later this week**

Term 1 Lectures

See [online timetable](#) for dates for each topic.

Each lecture will address a “Communications” topic.

Communications Lectures this term include:

- Creating a PDP;
- Time Management;
- Careers;
- Research Skills;
- Academic Writing;
- Problem Solving Skills;
- Exams and Revision.

Lab Sessions

Start in **week 2** of term 1.

You must attend **one** CS133 lab session each week (see Tabula for allocation).

Each lab you will have “marking points” to be checked off by a tutor. If you miss one (and have let Mike know!) you can get the marking points checked off the following week (but no later).

The labs in term 1 count for 20% of the module credit.

Module Assessment

The term 1 ***systems*** component will be assessed on the basis of the work developed during **lab sessions** in Term 1.

The ***communications*** component will be assessed via an **essay** and a **presentation** in term 2.

The ***legal, social and ethical*** material will be assessed by a **class test** at the end of term 2.

You will also begin ***PDP*** (Professional Development Planning) which will be assessed by a **personalised plan** at the start of term 3.

Recommended Books and Resources

We will suggest reading for specific module topics:

- Don't rush out to purchase these!
- Module website contains copies of necessary documents and recommended web resources.
- University Library has many copies of useful books and often online pdf versions.
- See <https://warwick.ac.uk/fac/sci/dcs/teaching/material/cs133/>
- **We do NOT use Moodle in this module!**

University of Warwick Computing Society
(uwcs.co.uk) is useful.

Linux and your Personal Computer

(1) You must be familiar with the DCS systems, and you **must** use them when you are **instructed** to do so (e.g., for the CS133 labs).

(2) You are **strongly encouraged** to explore Linux (and operating systems in general), and you may wish to install one on a virtual machine (VirtualBox, VMware, QEMU, Parallels) on your personal machine. These are discussed in more detail in the Computer Security module.

(3) *Don't over-write the native OS on your own machine unless you are absolutely confident you know what you are doing!*

Studying at University

A few basic points to remember.

This is not school! No-one will be “looking over your shoulder”.

- Read Student Handbook
 - Attend all timetabled sessions
 - Talk to us if a problem arises
- ... or just talk to us if you're interested!

Assimilating Material

There will be a lot of information

Make notes during lectures

- Lecture capture is not a substitute for attendance
- Don't just rely on your memory

Attend all timetabled sessions and complete “homework”

- There will be a lot of seminar work, labs, reading, etc.
- Manage your time (see lecture week 3)
- Talk to us (start off with personal tutor) if a problem arises

Homework

Make sure you are **comfortable** with logging into DCS machines and opening a terminal, an editor (*Atom, KEdit, Kate, NEdit, Emacs, vi, etc..*) and a browser (*Firefox, Chrome*).

Revise the **material** from the Welcome Week (if you were here).

Understand the Linux documentation given to you with CS118.

Do this by the end of week 2.

Q & A

Any questions?
